University of Warwick Poster

Designing evidence people can act on

Context

Research is easier to communicate when the question, method, and decision are visible together. This starter gives a technical project a clear narrative with enough space for evidence and limitations. **Question**

How can a compact, repeatable workflow make results easier for another reader to evaluate? **Method**

Question → Measure → Compare → Decide **Study design**

We compared a baseline process with the proposed workflow using repeated trials and a fixed review protocol. Replace this sample paragraph with the details of your own project.

Results

Measure	Baseline	Proposed
Agreement	58%	**88%**
Review time	26 min	**15 min**
Complete records	63%	**94%**

Main finding

2.1×
faster shared decisions

Interpretation

The largest gain came from making assumptions explicit at the start. The result remained stable across the repeated trials, while the review process became easier to audit. **Evidence**

Use this space for a figure, a short table, or one carefully chosen visualization. Keeping the evidence close to its interpretation helps readers follow the argument.

Conclusion

A good poster is a coordination tool: it makes the next action visible without hiding uncertainty. Replace this conclusion with the strongest defensible claim from your work. **Limitations**

The sample is deliberately small and the test setting is controlled. Transfer to other populations, environments, or operating conditions should be tested before making a broader claim. **Next steps**

- Extend the evaluation to new conditions.
- Release the smallest reproducible artifact.
- Compare independent teams or sites.

Takeaway

Make the evidence trail easy to follow. **Contact**
